

ABSTRACT OF THE DISCLOSURE

The present invention relates to a combination convertible article useful as a jacket and tote bag in one in which the jacket is reversible. It is designed to be a convenient and practical jacket suitable for light travel and active wear. The jacket can quickly be turned into a tote bag by executing maneuvers that are basic and simple. The jacket has as a part of its structure a double layer of material that is sewn together, which is the sack portion with one of the surfaces having an opening leading to a sack portion. The sack portion can be inverted to secure the jacket into the sack, thus forming the tote bag structure. In addition to the tote bag structure, the jacket is comprised of a reversible feature that exist due to the result of the double layer of material sewn together and it is worn in the reverse mode in which the reverse mode prohibits any indication of the jacket's multiple functions and enables the back piece, which is the sack and the sack portion opening of the jacket to be protected without the use of any closing devices and or fixtures and allowing the appearance of the said sack portion to be completely concealed.
